AxiomV™ SOFTWARE MODULES

Electronic Building Access Request - EBAR

What is EBAR?

Electronic Building Access Request or EBAR is an add on module to the AxiomV platform that gives ownership of the Access Control system doors to one or more personnel allowing them to manage their own cardholders from the companies Intranet.

The benefits of using EBAR

The concept is simple… in a traditional system the person programming the system is responsible for adding the cards. This means they are also responsible for any mistakes!

EBAR removes this point of fail by giving authorization to the rightful door owner(s). Only when all owners of a door accept the request the card is downloaded to the proper door for normal access control use.

Authorization Accountability

Places the responsibility of door authorization to the rightful door owner

Reduces Liability

Door authorization is 100% inadvertent assigning of access levels is eliminated.

Full logging audit trail

Time and Date of not only card authorization but also card requests is completely logged for tracking of suspicious requests! Required by many financial institutions.

Work load Distribution

Many systems require 100's if not 1000's of card changes per week . This responsibility increases the work load on the system administrator dramatically. EBAR removes this work load and distributes it to the door owners saving time and money.

Customizable to fit your Companies Intranet

EBAR fits on any windows Intranet and as such easily fits into any companies web design becoming a seamless interface for company employees.
