# Add Two Levels of Functionality to an AxiomXa Enterprise System

The Active directory Interface is a software add-on module for the RBH AxiomXa Enterprise software that adds two levels of functionality to the Axiom system. When activated the AxiomXa system will a) Authenticate the operator logon through the end users Active Directory and b) allow card holder import from the end users Active directory tables.

PART A

Operator Logon Authentication

When activate the operator logs on to AxiomXa using their Active Directory logon. AxiomXa looks to the Active Directory and verifies the Logon exists and that it privileges to run AxiomXa. If valid then AxiomXa starts as normal with all assigned privileges.

PART B

Cardholder Import from Active Directory

To activate this functionality the Import utility must be purchased along with the Active Directory interface. This feature allows the users in the Active directory to be imported into AxiomXa on a scheduled basis as cardholders. This method connects the databases and creates a single data entry point for employee information to 'flow' into the Axiom system without the need for administration within AxiomXa. Cardholders and credentials can be added / deleted or simply updated from the Active Directory. Using this method all changes are implemented to the controllers in real time.
