Asset Tracking Module

To prevent theft of your organization's assets, our Integrated Asset Tracking system is designed to help stop persons leaving with valuables they are unauthorized to remove from the premises.

Our fully integrated database will link individual assets with their owners and maintain a picture database of both the protected valuables and their assigned owners.

Once our system knows to whom individual items belong, it is then able to notify authorities of an attempted theft and if needed to lock down doors to prevent an asset from leaving the premises.

Asset tracking works to make sure that only an authorized driver can take a designated vehicle out of a garage or a parking lot.

Full video integration can be used for an additional visual verification as well as a record of the events.

- Multiple hardware brands supported
- Video Verification & DVR Integration
- Asset & Owner Images made & displayed
- Vehicle Assignment & Container Tracking
- Comprehensive monitoring & reporting

- Seamless integration
- Real-time operation
- Works with PC down
- Live location display
- Easy to retrofit

The Asset Tracking system operates by detecting the tag attached to an asset and requiring the use of a card or another security credential to authorize the removal of the item from the premises.

Asset Tracking can be easily added to any access point controlled by the AxiomXA Security Management System without the need for an additional panels and controllers.
